

Limit value switches in block-version as economical alternative to the well proven executions

Now available: Contacts in block-version!

Our well proven low- and snap-action contacts will be now available as block-version contacts. The patented contact base will carry in this version all single contact plates as one unit. With that feature a very stable construction about the overall height of the contact will be achieved. The electrical connection will be done with flat receptacles from the back side of the contact.

The adjustment range of the setting pointer will be assured for the complete scale range then. The technical execution is constructed with the well proven materials, used within all our contacts that we currently supply.

We will offer this version at very attractive conditions.
